ParishSOFT®

VERSION 4.4.4 RELEASE NOTES

These release notes document new features, changes, and enhancements in Release v4.4.4 of the AIM Suite.

Contents

ParishSOFT Version 4.4.4 Release_last updated July 16, 2018

AIM Suite

Family Directory

Resolved Issues

Family Details

Giving History Totals for Merged Families Corrected

Previously after a merge, a family's pledges and contributions were not merged into the master record, resulting in incorrect Giving History totals. We fixed the issue. The merge process now brings in the family's giving history data and correctly calculates their Giving History totals.

Duplicate Checker

Resolved Issues

System Now Successfully Merges Records of Families Making Anonymous Gifts

Previously, a merge did not complete if one or both families being merged were used as the family to which anonymous gifts were attributed during the import process from Online Giving. With this update, records of families designated as "anonymous" in Online Giving whose gifts are imported into ParishSOFT Offering can now be merged successfully.

'DELETE statement' and 'REFERENCE constraint' Conflict Error Resolved

Previously when the user tried to merge two member records or merge two family records, the system sometimes, generated this error:

```
The DELETE statement conflicted with the REFERENCE constraint
```

The error conditions causing these conflicts were resolved.

Member Strengths Conflicts No Longer Cause Merge Process to Stop

Previously, the merge process could not transfer member strength values assigned in the duplicate record to the master record. This conflict caused the process to stop abruptly. We resolved this issue. Member strength values in the duplicate record now merge successfully into the master record.

Unexpected Religious Education Data No Longer Causes Merge Error

Previously, the merge process generated an error when it encountered an unrecognized Religious Education data value in one of the records it was attempting to merge. This data value was inserted after a Religious Education Admin Reset was performed on an organization's Religious Education data. We modified the merge process to correctly handle merges when it encounters the data value in a family's record.

'INSERT statement' and 'FOREIGN KEY constraint' Conflict Resolved

Previously when the user tried to merge certain records, the system generated this error:

```
The INSERT statement conflicted with the FOREIGN KEY constraint
```

The issue creating this conflict was resolved.

System Is Now Retains All of the Duplicate Family's Organizational Associations After a Merge

Previously when two family records were merged, if the duplicate family had multiple organizational associations, only associations in common with the master family were retained. Any associations unique to the duplicate family were dropped. We fixed this issue. All of the duplicate family's associations to organizations are merged into the master family's record.

Merge Process Can Now Handle Long Organization Names

We resolved an issue that caused the merge process to generate an error if an organization's name was too long. We expanded the limit on the length of the organization name field to prevent this error.

Non-Matching Anointing of the Sick Sacrament Records No Longer Cause Merge Errors

Previously, if the duplicate member's record anointing of the sick sacrament record contained one or more sacrament records and the master record contained none, the system generated this error:

```
The DELETE statement conflicted with the REFERENCE constraint
```

We fixed this issue. The system is not able to successfully complete the merge and transfer the duplicate member's anointing of the sick sacrament records to the master record.

Unexpected Data Value Associated with Contribution Statements No Longer Causes Merge Error

Previously, the merge process generated an error when it encountered an unrecognized data value associated with contribution statements in one or both records it was trying to merge. We fixed this issue.

IQ

Resolved Issues

Query Timeout Error Resolved

Previously, queries designed using any of the fields listed in the **Fund – Organization Summary** group caused the system to generate a timeout error. We fixed this issue.

ParishSOFT Version 4.4.4 Release_last updated July 16, 2018

Status Animarum

Resolved Issues

System No Longer Prevents Some Users from Logging In

Previously, users whose last name begins with 'Z' could not log in to the system. We fixed this issue.

Subsequent Updates to the 4.4.4 Release

We strive to ensure a problem-free version update. Nevertheless, some issues occasionally arise after a major release. We fix such issues quickly in subsequent updates to the software. The following table lists the issues that were encountered in the v4.4.4 release that were quickly resolved in a subsequent update.

Table 1. Issues Resolved in the v4.4.4.61 Update

Module	Issue Description	Update
AIM Family Directory	Address data not visible in desktop applications after changes synced from ParishSOFT Family Suite When address changes made in ParishSOFT Family Suite are synced down to the desktop, data in these fields is not visible: **City**, **State/Region**, and **Postal Code**. ⚠️ **IMPORTANT** **This issue only impacts address data in organizations synching changes from the Web application to the desktop. Note that address data is not lost. It is present but cannot not be seen.**	This issue was resolved. After the user updates an address field in a family's record in ParishSOFT Family Suite, data in the **City**, **State/Region**, and **Postal Code** fields in these desktop applications is now visible: Aim Family Directory, Parish IQ, and desktop Family Directory.

Table 2. Issues Resolved in the v4.4.4.64 Update

Module	Issue Description	Update
AIM Family Directory	Address data not visible in desktop records after syncing from ParishSOFT Family Suite	Address data was restored to all records impacted by syncing issue.
Duplicate Checker	Merge fails if internal Home Organization ID field in the member's record is null	This issue was resolved. The merge process does not stop if it encounters a null value in the internal Home Organization ID field in the merged member's record.
